DETAILED ACTION

- Response to the petition decision to revive the application dated 4/1/2009
- Claims 1-12 and 14-16 have been Cancelled
- Claim 13 is pending
- Claim 13 is allowed

Response to Arguments

1. Applicant's arguments and amendment filed on 12/10/2008, with respect to claim 13 have been fully considered and are persuasive. The rejection of claim 13 under section 102(e) has been withdrawn.

Allowable Subject Matter

2. Claim 13 is allowed.

REASONS FOR ALLOWANCE

The following is an examiner's statement of reasons for allowance:

3. Independent claim 13 of the instant application teaches, for example, a maximum likelihood (ML) sparse decoder for block codes comprising:
a hypothesis generator operational to iterate over all possible values of a predetermined transport format combination indicator (TFCI).;

a code word generator operational to generate a corresponding encoded TFCI for the hypothesis that is being decoded in a desired iteration;

a correlator operational to correlate the corresponding encoded TFCI to the output of an associated rake receiver, the correlator comprising;

a plurality of multiplexers, each multiplexer having a first input for receiving a corresponding bit of the received transport format combination indicator (TCFI) signal, a second input for receiving the sign of the corresponding bit of the received transport format combination indicator (TCFI) signal, and a control input for receiving a corresponding bit of the encoded TFCI generated by the code word generator, and

a summer for adding the outputs of the multiplexers to generate a final correlation value; and

a maximum finder operational to compare the final correlation value for the current iteration with that of the immediately previous iteration to determine the most correlated hypothesis.

The following limitations are not found in the prior art of record, particularly, none of the prior arts of record teach nor fairly suggest,

a maximum likelihood (ML) sparse decoder for block codes comprising:
a hypothesis generator operational to iterate over all possible values of a predetermined transport format combination indicator (TFCI).;

a code word generator operational to generate a corresponding encoded TFCI for the hypothesis that is being decoded in a desired iteration;
a correlator operational to correlate the corresponding encoded TFCI to the output of an associated rake receiver, the correlator comprising:
a plurality of multiplexers, each multiplexer having a first input for receiving a corresponding bit of the received transport format combination indicator (TCFI) signal, a second input for receiving the sign of the corresponding bit of the received transport format combination indicator (TCFI) signal, and a control input for receiving a corresponding bit of the encoded TFCI generated by the codeword generator, and
a summer for adding the outputs of the multiplexers to generate a final correlation value; and
a maximum finder operational to compare the final correlation value for the current iteration with that of the immediately previous iteration to determine the most correlated hypothesis.
